Outline

- Motivation
- Approach for stretchable display substrates
- Simulation
- Mechanical properties
- Further properties: Optics, Shelf life, Ageing
- Dielectrics and Conductors
- Outlook and Conclusion

Motivation: Substrates for stretchable Displays

Different approaches to engineer substrates for stretchable Displays

KAIST: Rigidization (Island-Bridge) by SU-8 on PDMS

Motivation: Substrates for stretchable Displays

Frequent Challenges

Island-Bridge structures

- Scaling of rigid islands
- Mechanical stability (border between rigid and elastic parts)
- Transparency / Scattering
- Alignment
- Elastic conductors needed

Wrinkling / Buckling structures

- Waviness
- Mechanical stability (release process)
- Functional, conformable materials needed

Mechanically engineered substrates

Approach by Fraunhofer ISC in cooperation with Korea University

- Small Scale rigidization by µ-patterning techniques
- Mechanical integrity by mechanical gradient between soft and rigid parts
- Good optical quality by high transparent material and low variation of refr. Indices between soft and rigid parts
- Low surface roughness
- No ageing

→ Patent filed in 2019

Dual-Cure approach for elastomeric substrates

Base technology

→ Inorganic part was changed to become elastic (similar to PDMS): 2-dim network
→ Organic Part is used to rigidize the elastic substrate by UV cross-linking

ORMOCER®s, developed by Fraunhofer ISC, trademark of Fraunhofer-Gesellschaft zur Förderung der angewandten Forschung e.V., München

Dual-Cure approach for elastomeric substrates

1.Synthesis of modified PDMS precursors that contains different reactive groups

R1, R2

2. Adding components to carry out hydrosilylation using by thermal curing

R1 (forming the elastomeric network)

3. UV lithography (in absence of oxygene) in order to additionally cross-link on selected locations using

R2 (forming the rigid island)

- ightarrow Stretchable substrates with rigid islands
- ightarrow soft mechanical transition
- \rightarrow Low optical differences
- ightarrow No topography

→ Molar Ratio between R1 and R2 controls the elasticity and the increase in mechanical stiffness

UV mask design: mechanical characterization

AL SOLUTIONS by Fraunhofer ISC

The 8th ICMAP & The 9th ISFM The 8th International Conference on Microelectronics and Plasma Technology The 9th International Symposium on Functional Materials

Simulation

Model with locally increased Young's Modulus (without stretching)

10% Stretching

- Deformation on elastic parts
- Small deformation on rigid parts
- Revealing of a topography

Largest stretching on border between rigid and soft parts Strain maximum between the rigid parts

Characterization by microscopy

Non stretched sample

Circle Diameter: 325 µm

Overall Stretching of 10%

Stretching rigid parts: 5.5%; stretching soft parts: 11,8%

→ Difference between Young's exposed and non-exposed parts have to be increased

Joint International Conference on **The 8th ICMAP & The 9th ISFM** The 8th International Conference on Microelectronics and Plasma Technology The 9th International Symposium on Functional Materials

Increase the rigidization factor by changing molar ratio between R1, R2

In order to increase the rigidization factor, the molar ratio between the reactive groups canbbe changed \rightarrow the total mechanical characteristic is changed

	R1 mol%	R2 mol%	Young's Modulus (unexposed) [MPa]	Youngʻs Modulus (exposed) [Mpa]	Stretchability (unexposed]	Stretchability (exposed]
Sample A	35	25	1.22	3.10	115.8%	58.8%
Sample B	35	31.6	0.54	8.60	124.8%	20.2%
Sample C	35	32	0.56	9.71	123.7%	11.7%
Sample D	35	38	1.30	18.80	125.5%	10.7%
Sample E	35	45	1.50	18.90	109.1%	8.3%

Increase the ridigization factor by changing molar ratio between R1, R2

- → Young's Modulus is not further increased over ~ 38 mol% → Elongation at broak sooms to achieve a maximum value at 38 mol%
- ightarrow Elongation at break seems to achieve a maximum value at 38 mol%

 $\ensuremath{\mathbb{O}}$ Fraunhofer ISC, pictures as mentioned above or $\ensuremath{\mathbb{O}}$ Fraunhofer ISC

Mechanical characterization on µ-scale?

Nano-indentation:

- Difficulties to locate the indenter
- Effects of underlying substrates

Mapping of a sample via Forcedistance curves via AFM measurements

- → Incline of the curve correlates with the hardness of the sample
- \rightarrow No/Low hysteresis observed
- → Different behavior on top side / back side (exposed to UV)

Quantitative correlation to Young's Modulus could not be realized

Joint International Conference on The 8th ICMAP & The 9th ISFN The 8th International Conference on Microelectronics and Plasma Technology The 9th International Symposium on Functional Materials

Further properties: Optical transparency

Measurement of transparency and haze:

- UV unexposed
- UV exposed
- UV exposed after stretching
- \rightarrow No yellowing
- → No significant increase in haze after stretching or UV exposure
- → Absorption edge between 380 and 400 nm

Further properties: Shelf life

- Formulation prepared (without UV initiator and catalyst)
- Measurement of viscosity when stored at different temperatures
- Storing at room temperature: no increase in viscosity after 1200 hrs (50 days)
- When stored at 40 °C, viscosity increases after about 3 weeks

Further properties: Ageing

How sensitive are the soft parts when stored in ambient UV light or exposed by UV light in presence of oxygen?

Storage Time	Young's Modulus	Elongation at break
0 d	1.16 MPa (± 0.15)	106.3% (± 19.1)
7 d	1.05 MPa (± 0.10)	107.5% (± 23.5)
14 d	1.58 MPa (± 0.15)	94.5% (± 25.3)
Fully exposed	8.13 MPa (± 0.31)	27% (± 1.8)

- → In Presence of oxygen, there is almost no increase in Young's Modulus by ambient UV light
- → UV exposure in presence of oxygen does also not result in an increase of Young's Modulus
- \rightarrow Additional UV protection can be applied

Dielectrics and Conductors

By changing the process sequence, the material can be used as stretchable patternable dielectric or matrix for composites, such as Ag-Nw

- ightarrow Application of the material on a substrate
- → Patterning the material by UV exposure, (cross-linking R2)
- → Development of the material in organic developer
- \rightarrow Curing the sample, cross-linking R1
- → Stretchable Dielectrics:

$$\rightarrow$$
 "Low-k": $\varepsilon_r = 3.4$

$$\rightarrow$$
 "High-k": $\varepsilon_r = 4.3$

Subsequent processing

Wetting behavior on stretchable substrates can be improved by combined UV/ozone treatment

Thins film capacitors built up on stretchable substrate using stretchable dielectrics

201002_zieg_p_0001_36h250°C_PS129 (th: 0,47 μm)

Joint International Conference on **The 8th ICMAP & The 9th ISFM** The 8th International Conference on Microelectronics and Plasma Technology The 9th International Symposium on Functional Materials Test wafer for thermal stressing: Dielectric layer after 36hrs, 250 °C

Stretchable Conductors

Ag-Nw can be incorporated into the stretchable matrix and can be patterned

AgNw-Composite

Fraunhofer

Outlook: Symphony – Stretchable Energy Harvester (EU project)

Stretchable Nanogenerators to harvest energy from vibrations, deforming and stray fields:

- Piezoelectric
- Triboelectric
- Magnetoelectric

Based on composites of PVDF

 \rightarrow In order to apply large deformations to nonstretchable PVDF piezopolymers, stretchable PVDF composites will be investigated

Conclusion

- Dual-Cure elastomeric hybrid polymer might be a well suited substrate for stretchable displays
- Requirements important when used in industrial process can be met
- The difference in mechanics between soft and rigid areas might be enhanced further
- Concept can also be applied for
 - Dielectrics
 - Conductive composites such as AgNw-composites
 - Sensors (\rightarrow Symphony)
